

## **Genomic Vision joins the CAC<sup>®</sup> Mid & Small index**

**Bagneux (France) - Genomic Vision (FR0011799907 – GV / PEA-PME eligible)**, a molecular diagnostics company that specializes in the development of diagnostic tests for genetic diseases and cancers using the DNA molecular combing process, today announces that it has been selected to incorporate the CAC<sup>®</sup> Mid & Small index from the start of trading on September 22, 2014.

Calculated in real-time, the CAC<sup>®</sup> Mid & Small index includes Mid and Small stocks that meet selective criteria in terms of revenue, total assets and daily trading volumes.

Genomic Vision will also incorporate the CAC<sup>®</sup> Small and CAC<sup>®</sup> All-Tradable indexes, the latter continually providing the trend of companies listed on the Paris stock market. These indexes are used as references by a number of mutual and SICAV open-end investment funds.

**Aaron Bensimon, Genomic Vision's co-founder and Chairman, comments:** *"We are delighted about Genomic Vision's integration in these CAC<sup>®</sup> indexes, which highlights our stock's good liquidity just a few months after our IPO. This integration will help increase our visibility on the main European markets and will make it easier for investors to access our share capital."*

### **ABOUT GENOMIC VISION**

A spinoff of the Institut Pasteur, Genomic Vision is a molecular diagnostics company specialized in developing diagnostic tests for genetic diseases and cancers. Using "molecular combing", an innovative technology that allows the direct visualization of individual DNA molecules, Genomic Vision detects quantitative and qualitative variations in the genome that are at the origin of numerous serious pathologies. Having benefited from the financial support of the Institut Pasteur, SGAM AI, Vesalius Biocapital and Quest Diagnostics, the Company is developing a solid portfolio of tests that notably target breast cancer and cancer of the colon. Since 2013, the Company has marketed the CombHeliX FSHD test for identifying a myopathy that is difficult to detect, Facio-scapulo-humeral dystrophy (FSHD), in the United States thanks to a strategic alliance with Quest Diagnostics, the American leader in diagnostic laboratory tests, and in France.

### **ABOUT MOLECULAR COMBING**

DNA molecular combing technology considerably improves the structural and functional analysis of DNA molecules. DNA fibers are stretched out on glass slides, as if "combed", and uniformly aligned over the whole surface. It is then possible to identify genetic anomalies by locating genes or specific sequences in a patient's genome using genetic markers, an approach developed by Genomic Vision and patented under the name Genomic Morse Code. This exploration of the entire genome at high resolution via a simple analysis enables the direct visualization of genetic anomalies that are undetectable by other technologies.
